

Final Reflection

- I had problems with creating a custom Form recognizer. I couldn't get access to the blob storage. I asked the community but unfortunately, they can not help me. I try creating blob storage from scratch but it doesn't work. I end up using the last version of Form Recognizer v3 finally I can create the custom model but I have to do some research on my own.
- I did not have access to videos to validate the other passenger's identity. I left that column blank on my final manifest file.

Overall I have a lot of issues trying to do the exercises most of them were about credentials and permission trying to connect azure services. I also find that there are a lot of different versions of the same service which makes you be very careful with the version you are using. Microsoft updated them a lot. The best way to use these AI services is always to check the documentation there is a lot and is very well organized.

I really enjoyed working on this project I wish I had more time to create a nice UI and also host and small web page.
